 Inclusions: **Cloud**
 Symmetry: **Good**
 Fluorescence: **None**
 Comments:
 Properties not shown.
**TABLE 2: GIRDLE THICKNESS**

The girdle thickness of a diamond is an important attribute of a diamond's quality. It is the thickness of the diamond's girdle, the area between the crown and the pavilion. The girdle thickness of a diamond is measured in millimeters (mm) and is typically between 0.5 mm and 1.0 mm. A diamond with a girdle thickness that is too thin or too thick may have a higher risk of chipping or cracking. The girdle thickness of a diamond is also an important factor in determining its weight and its value.

EMERALD CUT

Emerald cut diamonds have a unique step-cut design that gives them a distinctive look. The facets are large and flat, which makes them a popular choice for jewelry. The facets are arranged in a way that creates a series of parallel lines, giving the diamond a "hall of mirrors" effect. This design is ideal for showcasing the natural clarity and color of the diamond. Emerald cut diamonds are often used in engagement rings, pendants, and earrings.
